
a
Connected share rises with observing stations
Connected share of opportunities
Observing upstream stations, k
1 − (1 − p̂)^k, 95% ribbon
Ebro, p̂ = 0.164 (0.14–0.20)
Volta, p̂ = 0.162 (0.07–0.28)
mean k per opportunity
b
Thinning lowers the share but not p̂
Ebro thinned to 5–33 stations
connected share of opportunities
per-link probability
Probability
Volta
Volta
Mean observing upstream stations per opportunity
c
Power grows with opportunities
test statistic (95% bootstrap ribbon)
connected share
per-link probability
Power, α = 0.05
50%
366 for 50%
Ebro, 928
Volta, 40
